

1.5.3 System and Enterprise Architects

Return to 1.5 Intended Audience

System and enterprise architects design, evolve, assess, and integrate environments that support the interpretation of regulated data, including financial data used in supervisory, oversight, and cross-agency contexts. These architects operate within individual organisations and across organisational, agency, and jurisdictional boundaries.

For these audiences, the [reference_architecture](#) provides structural clarity, defined responsibilities, explicit architectural boundaries, and governed interface constraints that support consistent system design, integration, evaluation, and evolution.

FDIS-RA enables architects to align implementations with governed [semantic](#) interpretation responsibilities without unnecessarily constraining technology selection, implementation approach, platform choice, deployment model, or organisational topology.
