

C.3.1 Configuration Management

[Go to Crucible Functional Requirements](#)

The Configuration Management requirements define the behaviors that [Crucible](#) performs to create, validate, maintain, version, select, compare, and apply controlled configuration information.

These requirements establish the configuration controls required to preserve consistency, [Provenance](#), [Reproducibility](#), and [Traceability](#) throughout the [Operational Lifecycle](#).

Notes for Editors

The individual requirement pages should retain the stable identifiers FR-CFG-001 through FR-CFG-005.

Individual requirement pages are leaf nodes and should not include a trailing `:start` in their namespaces.

The Source Statement on each requirement page should preserve the original wording from the controlling System Requirements Specification.

Normalized Statements should use direct, testable behavior and should identify the applicable configuration artifact, controlled input, operation, result, and acceptance criteria.

Incoming traceability should use the wiki Backlinks function rather than a manually maintained list.

To reference a requirement Statement from another wiki page, insert:

```
{{section><namespace>#Statement&noheader&nofooter&noeditbtn}}
```

Replace `<namespace>` with the namespace of the requirement leaf page.

The section name following `#` SHALL match the section heading verbatim on the requirement page.

Do not rename a requirement page after an external citation unless a redirect or move plan is in place.
