

ENV-001d — Identify Included Nodes

[Go to ENV-001 — Define Test Environment](#)

Statement

The [DIDO-TE](#) SHALL identify each [Node](#) included in a [Test Environment](#).

Derived From

- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Identifying the included [Nodes](#) establishes the distributed composition of a [Test Environment](#).

The recorded composition supports confirmation that the Test Environment contains the Nodes required by each applicable [Test Definition](#). It also provides the basis for defining communication relationships, assigning [Configuration](#) values, applying [Constraints](#), and relating resulting [Evidence](#) to the Nodes participating in a [Test Execution](#).

Applies To

- [Test Environment](#)
- [Node](#)

Verification

Verification confirms that:

- Each Test Environment identifies every included Node.
- Each identified Node has an explicit relationship to the Test Environment.
- Each Node present in the Test Environment appears among the identified Nodes.
- An unidentified Node present in the Test Environment constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the controlled information for each Test Environment
- Inspection of the Nodes present in the Test Environment
- Comparison of the identified Nodes with the Nodes present in the Test Environment
- A negative assessment using a Test Environment containing an unidentified Node
- Confirmation that the negative assessment produces a nonconformance result
