

ENV-002f — Establish Communication Relationships

[Go to ENV-002 — Configure Test Environment](#)

Statement

The [DIDO-TE](#) SHALL establish each communication relationship specified for a [Test Environment](#) before [Test Execution](#).

Derived From

- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Establishing each specified communication relationship provides the controlled information paths required among the [Test Objects](#), [Nodes](#), [Test Resources](#), and supporting services within a [Test Environment](#).

Each communication relationship determines the participating endpoints and the applicable direction, protocol, interface, data exchange, addressing, quality, and security conditions.

Establishing and verifying these relationships before [Test Execution](#) prevents missing, incorrect, or unintended communication paths from affecting execution or the resulting [Test Results](#).

Applies To

- [Test Environment](#)
- [Test Object](#)
- [Node](#)
- [Test Resource](#)
- [Configuration](#)
- [Constraint](#)
- [Test Execution](#)

Verification

Verification confirms that:

- The DIDO-TE establishes every communication relationship specified for the Test Environment.
- Each established communication relationship connects the specified participating endpoints.
- Each established communication relationship has the specified direction, protocol, interface, addressing, data exchange, and quality characteristics, when applicable.
- Each established communication relationship satisfies its applicable security and environmental Constraints.
- The configured Test Environment excludes communication relationships prohibited by its controlled information.
- The DIDO-TE records each established communication relationship as part of the resulting Test Environment Configuration.
- The DIDO-TE maintains [Traceability](#) between each specified communication relationship and its configured instance.
- A missing, incorrect, prohibited, or untraceable communication relationship constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the communication relationships specified for the Test Environment
- Inspection of the endpoints and characteristics of each established communication relationship
- Testing of communication across each required relationship
- Testing for the absence of each prohibited communication relationship
- Comparison of the observed communication relationships with the controlled Test Environment information
- Inspection of the resulting Test Environment Configuration
- Inspection of Traceability records connecting each specified communication relationship to its configured instance
- A negative assessment using a missing, incorrect, prohibited, or untraceable communication relationship
- Confirmation that the negative assessment produces a nonconformance result
