

ENV-002I — Validate Test Environment Configuration

[Go to ENV-002 — Configure Test Environment](#)

Statement

The [DIDO-TE](#) SHALL validate the resulting [Test Environment Configuration](#) against its controlled descriptive information before [Test Execution](#).

Derived From

- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Validating the resulting [Test Environment Configuration](#) determines whether the instantiated and provisioned environment conforms to its controlled descriptive information.

Validation compares the actual Test Objects, Nodes, Test Resources, Configuration values, communication relationships, constraints, Deployment Targets, versions, [Baselines](#), and supporting services with their specified states.

Completing validation before [Test Execution](#) prevents an invalid or uncontrolled Test Environment Configuration from affecting execution or undermining interpretation of the resulting [Test Results](#).

Applies To

- [Test Environment](#)
- [Configuration](#)
- [Validation](#)
- [Baseline](#)
- [Test Object](#)
- [Node](#)
- [Test Resource](#)
- [Deployment Target](#)
- [Test Execution](#)
- [Evidence](#)

Verification

Verification confirms that:

- The DIDO-TE validates the resulting Test Environment Configuration before Test Execution.
- Validation compares the resulting Configuration with the applicable controlled descriptive information.
- Validation assesses the completeness and correctness of the instantiated Test Objects and Nodes.
- Validation assesses the completeness, correctness, and availability of the provisioned Test Resources.
- Validation assesses the applied Configuration values.
- Validation assesses the established and prohibited communication relationships.
- Validation assesses compliance with the applicable environmental, security, and deployment Constraints.
- Validation assesses the applicable Deployment Targets, versions, and Baselines.
- Validation produces a determinate conformance result.
- The DIDO-TE records the validation method, observations, findings, result, and applicable Configuration as Evidence.
- The DIDO-TE maintains [Traceability](#) among the controlled descriptive information, resulting Configuration, validation Evidence, and applicable Test Execution.
- The DIDO-TE prevents Test Execution when validation identifies an unresolved nonconformance.
- Missing, incomplete, unsuccessful, or untraceable validation constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the controlled descriptive information governing the Test Environment
- Inspection of the resulting Test Environment Configuration
- Inspection of the validation method, observations, findings, result, and Evidence
- Comparison of the validated Configuration with the instantiated and provisioned Test Environment
- Inspection of Traceability records connecting the controlled information, Configuration, validation Evidence, and applicable Test Execution
- A negative assessment using a Test Environment Configuration containing a known nonconformance
- Confirmation that validation identifies the nonconformance
- Confirmation that the DIDO-TE prevents Test Execution while the nonconformance remains unresolved
