

ENV-003i — Remove or Isolate Residual State

[Go to ENV-003 — Establish Controlled Starting State](#)

Statement

Before each [Test Execution](#), the [DIDO-TE](#) SHALL remove or isolate each residual state element not included in the required controlled starting state.

Derived From

- [ENV-003 — Establish Controlled Starting State](#)
- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Residual state includes data, processes, messages, files, caches, temporary resources, communication relationships, credentials, locks, subscriptions, transactions, and other state remaining from a prior activity or [Test Execution](#).

Residual state may alter the behaviour of a [Node](#), [Test Object](#), or supporting [Test Resource](#).

Removing or isolating residual state prevents a prior Test Execution or unrelated activity from influencing a later [Test Result](#). This separation supports [Reproducibility](#) and [Comparability](#).

Applies To

- [Test Environment](#)
- [Test Definition](#)
- [Test Execution](#)
- [Node](#)
- [Test Object](#)
- [Test Resource](#)
- [Test Input](#)
- [Configuration](#)
- [Constraint](#)
- [Evidence](#)

Verification

Verification confirms that:

- The DIDO-TE identifies residual state before Test Execution.
- The DIDO-TE determines whether each identified residual state element belongs to the required controlled starting state.
- The DIDO-TE removes or isolates each residual state element not included in the required controlled starting state.
- Isolation prevents the residual state element from influencing the applicable Test Execution.
- Removal or isolation addresses residual data, processes, messages, files, caches, resources, communication relationships, credentials, locks, subscriptions, and transactions, where applicable.
- The resulting Test Environment contains only state permitted by the controlled descriptive information.
- The DIDO-TE records each detected residual state element and the action taken.
- The DIDO-TE maintains [Traceability](#) among each residual state element, its originating activity when known, the removal or isolation action, and the applicable Test Execution.
- Unidentified, unremoved, ineffectively isolated, prohibited, or untraceable residual state constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the Test Environment following a prior Test Execution
- Inspection for residual data, processes, messages, files, caches, resources, communication relationships, credentials, locks, subscriptions, and transactions
- Observation of residual-state removal or isolation
- Confirmation that isolated residual state cannot influence the applicable Test Execution
- Comparison of the resulting Test Environment state with the required controlled starting state
- Inspection of residual-state detection and disposition records
- Inspection of Traceability records connecting each residual state element to its origin, disposition, and applicable Test Execution
- Repetition of a Test Execution following a prior Test Execution
- A negative assessment containing prohibited or ineffectively isolated residual state
- Confirmation that the negative assessment produces a nonconformance result
