

ENV-004I — Validate Environmental Determinism

[Go to ENV-004 — Provide Deterministic Test Environment](#)

Statement

The [DIDO-TE](#) SHALL validate environmental determinism before each [Test Execution](#).

Derived From

- [ENV-004 — Provide Deterministic Test Environment](#)
- [ENV-004j — Detect Environmental Variation](#)
- [ENV-004k — Record Environmental Variation](#)
- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Environmental determinism exists when the [Test Environment](#) satisfies the controlled conditions specified by the applicable [Test Definition](#).

Validation determines whether the applicable Baselines, Configurations, Test Inputs, time sources, random value sources, execution-ordering controls, resource allocations, external dependencies, and communication conditions satisfy their specified criteria.

Pre-execution validation prevents an invalid environmental condition from undermining the interpretation, [Reproducibility](#), or [Comparability](#) of the resulting [Test Results](#).

Applies To

- [Test Environment](#)
- [Test Definition](#)
- [Test Execution](#)
- [Test Object](#)
- [Node](#)
- [Test Input](#)
- [Test Resource](#)
- [Baseline](#)
- [Configuration](#)

- [Constraint](#)
- [Evidence](#)

Verification

Verification confirms that:

- The applicable Test Definition identifies each environmental condition subject to validation.
- Each validation criterion has a specified value, state, range, sequence, or tolerance.
- The DIDO-TE evaluates each validation criterion before Test Execution.
- The DIDO-TE identifies each criterion as satisfied or unsatisfied.
- The DIDO-TE produces an environmental-determinism validation outcome.
- A valid outcome requires satisfaction of every mandatory environmental criterion.
- The validation outcome identifies each unsatisfied criterion.
- The validation outcome identifies each detected environmental variation.
- The DIDO-TE records the validation outcome as [Evidence](#).
- The DIDO-TE maintains [Traceability](#) among the validation outcome, the Test Definition, the environmental conditions, and the proposed Test Execution.
- An omitted, incomplete, incorrect, unsupported, or untraceable validation constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the environmental criteria specified by the Test Definition
- Inspection of environmental-determinism validation procedures
- Observation of validation before Test Execution
- Comparison of specified and observed environmental conditions
- Testing with an environment that satisfies every mandatory criterion
- Testing with an unsatisfied Baseline or Configuration criterion
- Testing with an unsatisfied Test Input, time-source, or random-value criterion
- Testing with an unsatisfied ordering, resource, dependency, or communication criterion
- Inspection of validation outcomes, Evidence, and Traceability records
- Confirmation that each unsatisfied mandatory criterion produces an invalid outcome
