

NOD-004c — Confirm Node Readiness

[Go to NOD-004 — Control the Node Lifecycle](#)

Statement

The [DIDO-TE](#) SHALL confirm the readiness of each [Node](#) before the Node participates in [Test Execution](#).

Derived From

- [NOD-004 — Control the Node Lifecycle](#)
- [NOD-004a — Establish the Initial Node State](#)
- [NOD-004b — Start the Node](#)
- [\[DTE5\] DIDO-TE Requirements Register](#), source requirement identifier and obligation to be assigned
- [\[DTE6\] Structured Information Processing Reference Architecture \(SIP-RA\)](#)
- [\[DTE7\] Federated Data Interpretation Systems Reference Architecture \(FDIS-RA\)](#)

Rationale

Node readiness identifies whether a started Node satisfies the conditions required to perform its assigned role within a [Test Environment](#).

A completed start operation establishes that the startup procedure reached an endpoint. It does not demonstrate that the Node has initialized its required services, established its [Node Bindings](#), obtained required resources, reached a stable operating state, or satisfied the applicable [Test Definition](#).

Readiness criteria derive from the [Node Definition](#), [Node Implementation](#), [Node Configuration](#), Test Definition, and Test Environment.

Confirming readiness prevents a partially initialized, degraded, incompatible, unstable, or otherwise unsuitable Node from affecting Test Inputs, other Nodes, Test Resources, Test Results, or the integrity of Test Execution.

Applies To

- [DIDO-TE](#)
- [Node](#)
- [Node Definition](#)
- [Node Implementation](#)
- [Node Configuration](#)

- [Node Binding](#)
- [Dependency](#)
- [Test Definition](#)
- [Test Environment](#)
- [Test Resource](#)
- [Test Execution](#)
- [Test Result](#)
- [Evidence](#)
- [Traceability](#)

Verification

Verification confirms that:

- The DIDO-TE uniquely identifies the Node subject to readiness confirmation.
- The Node has completed its authorized start operation.
- The DIDO-TE identifies the Node Definition, Node Implementation, Node Configuration, Test Definition, and Test Environment applicable to the readiness determination.
- The DIDO-TE uses identified and authorized readiness criteria and procedures.
- The readiness criteria define the required Node state, services, interfaces, Node Bindings, Dependencies, Test Resources, security controls, and operational conditions.
- The DIDO-TE evaluates the actual Node state against the applicable readiness criteria.
- The DIDO-TE confirms that each mandatory service and interface is active and responsive.
- The DIDO-TE confirms that each mandatory Node Binding is established and available.
- The DIDO-TE confirms that each mandatory Dependency and Test Resource is available and compatible.
- The DIDO-TE confirms that the Node occupies the required lifecycle state.
- The DIDO-TE confirms that the Node Configuration corresponds to the configuration approved for the applicable Test Execution.
- The DIDO-TE confirms that the Node satisfies applicable security, access-control, isolation, jurisdictional, residency, and Governance constraints.
- The DIDO-TE confirms that the Node remains stable for any required observation period.
- The DIDO-TE distinguishes a successful start result from a successful readiness result.
- The DIDO-TE detects an incomplete, unsuccessful, expired, ambiguous, conflicting, or unauthorized readiness result.
- The DIDO-TE detects a Node that becomes unready after readiness has been confirmed.
- The DIDO-TE prevents a Node without a current and successful readiness result from participating in Test Execution.
- A material change to the Node Definition, Node Implementation, Node Configuration, Node Binding, Dependency, Test Definition, Test Resource, or Test Environment invalidates the applicable readiness result and triggers a new readiness determination.
- The DIDO-TE records each readiness criterion, procedure, observation, result, finding, exception, authority, and time.
- Repeated readiness determinations for an unchanged Node under equivalent conditions produce equivalent results within specified tolerances.
- The DIDO-TE maintains Traceability among the readiness criteria, readiness procedure, Node Definition, Node Implementation, Node Configuration, Node state, Node Bindings, Dependencies, Test Definition, Test Environment, Test Resources, readiness result, findings, exceptions, and resulting Evidence.

- An unready, incompletely assessed, unsuccessfully assessed, unauthorized, ambiguously assessed, or untraceable Node constitutes nonconformance with this requirement.

Verification includes:

- Inspection of the Node identity and completed start result
- Inspection of the authorized readiness criteria and procedure
- Observation of the actual Node state
- Confirmation of required services, interfaces, Node Bindings, Dependencies, and Test Resources
- Confirmation of applicable security, access-control, isolation, jurisdictional, residency, and Governance constraints
- Observation of the Node for the required stability period
- A negative assessment involving an unavailable mandatory service
- A negative assessment involving a missing or incompatible Node Binding
- A negative assessment involving an unavailable Dependency or Test Resource
- Confirmation that a Node without a successful readiness result cannot participate in Test Execution
- Confirmation that a material change invalidates the readiness result
- Inspection of readiness results, findings, exceptions, Evidence, and Traceability
