

Domain

[Return to Terms and Definitions](#)

Discussion

A Domain identifies a specific business or semantic area within an [ecosystem](#). It provides the classification level most directly associated with a domain profile.

Within the Monetary Ecosystem, a Domain may identify an area such as Foreign Exchange, Commercial Paper, Settlement, Liquidity, or another financial structured-information processing area.

A Domain provides the business and semantic scope inherited by later logical profiles, implementation profiles, deployment profiles, and evidence plans.

Definition:

Definition

specific business or semantic area within an [ecosystem](#)

Source

Adapted from FX Demo Reference Architecture, Section 2.1.17, Archetype Classification Codes; generalised from classification codes to conceptual classification levels for the Financial Systems Archetype.

Note

A Domain is not an implementation profile, a deployment environment, a DDS Domain ID, a runtime plane, or a topic namespace.

Example

Foreign Exchange is a Domain within the Monetary [ecosystem](#) of the Finance Ecosphere.
