

Ecosphere

[Return to Terms and Definitions](#)

Discussion

An Ecosphere identifies the broadest area of activity under governance within the [Archetype Classification Model](#). It provides the highest-level business, semantic, or institutional classification for an archetype.

For financial systems, the Ecosphere identifies the broad financial area in which an archetype operates. Later Ecosystems, Domains, Logical Profiles, Implementation Profiles, Deployment Profiles, and Evidence Plans inherit that high-level scope unless they explicitly define a different classification path.

Definition

broad governed area of activity within an Archetype Classification Model

Source

Adapted from **FX Demo Reference Architecture**, Section 2.1.17, **Archetype Classification Codes**; generalised from classification codes to conceptual classification levels for the Financial Systems Archetype.

Note

An Ecosphere is not a runtime identifier, deployment namespace, DDS Domain ID, repository path, or implementation boundary.

Example

Structured information-processing archetypes may use Finance, Healthcare, Public Administration, Trade, and Defense as Ecospheres.
