

Ecosystem

[Return to Terms and Definitions](#)

Discussion

An Ecosystem identifies a major functional, institutional, or semantic area within an Ecosphere. It narrows the scope of an archetype while remaining broader than an individual business domain.

Within the Finance Ecosphere, an Ecosystem may identify a major financial activity area such as Monetary, Securities, Insurance, Banking, Payments, Reporting, or Oversight.

An Ecosystem provides context for Domains. A Domain inherits meaning from its parent Ecosystem and from the Ecosphere containing that Ecosystem.

Definition

major functional, institutional, or semantic area within an Ecosphere

Source

Adapted from FX Demo Reference Architecture, Section 2.1.17, Archetype Classification Codes; generalised from classification codes to conceptual classification levels for the Financial Systems Archetype.

Note

An Ecosystem is not a runtime plane, a community of Interest, a Kubernetes namespace, a DDS partition, or a deployment target.

Example

The Monetary Ecosystem may contain Domains concerned with Foreign Exchange, Commercial Paper, Settlement, Liquidity, or monetary obligations.
