

FX Evidence Traceability

[Return to Terms and Definitions](#)

Discussion

FX Evidence Traceability relates FX logical profile elements and FX logical interactions to the [Evidence](#) expectations that later implementation, deployment, testability, and evidence plans satisfy.

FX Evidence Traceability does not create runtime [Evidence](#) in Part 3. It identifies what later parts need to evidence. It connects claims about FX logical behaviour to the FX logical [Nodes](#), endpoints, information structures, [Runtime Planes](#), interactions, governance constraints, lifecycle states, audit records, provenance records, and [Traceability](#) relationships that support those claims.

FX Evidence Traceability prepares Part 5 to define deployment evidence, captured messages, logs, status records, audit records, provenance records, replay results, test results, configuration snapshots, review records, and evidence packages.

Definition

Traceability relationship connecting FX logical profile elements and FX logical interactions to evidence expectations for later implementation, deployment, testing, and review.

Source

Specialisation of [Logical Evidence Traceability](#) from Part 2, Section 12.8, [Evidence](#) from Part 1, Section 7.9, and [Traceability](#) from Part 1, Section 7.10; generalised from FX acceptance evidence, audit, provenance, replay, reconstruction, and runtime evidence material in the original FX Demo Reference Architecture.

Note

FX Evidence Traceability identifies evidence expectations. It does not prescribe evidence files, logs, screenshots, dashboards, repositories, test tools, or runtime capture mechanisms.

Example

The Validate FX Transaction Candidate pattern includes an evidence expectation that later parts capture validation inputs, [FX Validation Results](#), the validation rule version, the producing [Node](#) identity, timestamp, and a provenance reference.
