FX Policy Decision Endpoint

Go up to Terms and Definitions

Discussion

The FX Policy Decision Endpoint carries policy decision information produced by the FX Policy and Release Node.

The endpoint supports governed access, disclosure, safeguarding, redaction, transformation, release, obligations, audit, provenance, and evidence expectations. It carries FX Policy Decision information that identifies the evaluated information, the requested recipient, the purpose, the decision, the rationale, the obligations, the policy context, the producing Node, the timestamp, and the provenance reference.

The FX Policy Decision Endpoint participates primarily in the FX Logical Policy and Release Plane. It also relates to the FX Logical Audit and Provenance Plane because policy decisions require a reviewable decision context and release accountability.

Definition

Communication Endpoint carrying policy decision information for governed FX release or handling

Source

Specialization of Logical Communication Endpoint from Part 2: Distributed Node-Based Logical Architecture, Section 7.2, Logical Policy Constraints from Part 2: Distributed Node-Based Logical Architecture, Section 11.7, and Policy and Release Plane from Part 1: Conceptual Architecture, Section 8.5; generalised from IEF policy-layer, policy-decision, and release-control material in the original FX Demo Reference Architecture.

Note

The FX Policy Decision Endpoint is not a policy engine, access-control product, redaction tool, gateway, DDS Topic, REST resource, RPC method, or deployment boundary.

Example

The FX Policy and Release Node publishes an FX Policy Decision that records whether selected FX information qualifies for release to an External Oversight Participant.
