

FX Transaction Intake Node

[Return to Terms and Definitions](#)

Discussion

The **FX Transaction Intake Node** receives candidate FX transaction information and introduces it into the FX Demo logical [Node](#) network.

The FX Transaction Intake Node performs transaction intake responsibilities. It accepts FX Transaction Candidate information, assigns or preserves required identifiers, records intake context, publishes transaction intake information, and supports [Traceability](#) from initial receipt to later validation, interpretation, contract state, cash-flow computation, audit, provenance, and [Evidence](#) expectations.

The FX Transaction Intake Node participates primarily in the [Logical Data Plane](#). It also participates in the [Logical Audit and Provenance Plane](#) when it records intake provenance, and in the [Logical Health and Observability Plane](#) when it reports operational condition.

Definition

FX logical [Node](#) responsible for receiving candidate FX transaction information and introducing it into the FX Demo logical node network.

Source

Specialisation of [Logical Node](#) from Part 2, Section 6.2, and [Node](#) from Part 1, Section 7.2; generalised from transaction intake material in the original FX Demo Reference Architecture.

Note

The FX Transaction Intake Node is not a user interface, file parser, API endpoint, DDS participant, REST resource, process, container, or deployment artefact. Implementation Profiles select the intake mechanism.

Example

The FX Transaction Intake Node receives an FX Transaction Candidate and publishes intake information for validation.
