

Python

[Return to Terms and Definitions](#)

Discussion

Python is used in the FX Demo implementation profile as an implementation language for selected Phase 0 nodes. Within the architecture document set, Python belongs to the implementation-specific technology layer and does not define conceptual or logical architecture meaning.

Definition

High-level programming language used to implement software components, scripts, tools, and automation.

Source

FX Demo Reference Architecture.

Note

Python is an implementation mechanism in the FX Demo document set. Logical Architecture / PIM elements remain independent of Python.

Example

A Phase 0 node implementation written in Python realises a logical node but does not redefine the logical node.
