

Structural Artifact

[Go up to Terms and Definitions](#)

Discussion

A structural artifact identifies a governed construct that defines the organization and constraints of [structured information](#).

Structural artifacts support consistent processing by defining how information is organized, constrained, validated, exchanged, and interpreted within the [Reference Architecture \(RA\)](#).

A structural artifact differs from a [Semantic Artifact](#). A structural artifact defines organization and constraints. A semantic artifact defines the meaning associated with structural elements or [data](#) values.

Definition

governed construct defining the organization and constraints of [structured information](#)

Source

Structured Information Processing [Reference Architecture \(RA\)](#)

Note

A structural artifact provides a controlled basis for validation, exchange, traceability, and evaluation of conformance.

Example

A schema, message structure, information model, interface structure, or constraint set is a structural artifact when the [Reference Architecture \(RA\)](#) governs its definition, versioning, authority, and use during structured information processing.
