

P4-REQ-21-11-009

[Return to Requirements](#)

Statement

The Developer Handbook SHALL define repository workflow requirements.

Source

Part 4, Section 21.11: Developer Handbook Requirements.

Rationale

Repository workflow requirements control how implementation artifacts enter, change within, and leave the Phase 0 implementation baseline.

Defined workflow protects the baseline from uncontrolled prototype code and preserves distinctions among governed source, generated artifacts, temporary material, local developer artifacts, and non-baseline material.

Applies To

This requirement applies to:

- repository contributions;
- generated artifacts;
- configuration and IDL changes;
- scripts;
- temporary and local artifacts; and
- review and contribution workflow.

Verification

Verification SHALL confirm that the Developer Handbook defines repository workflow requirements.

Verification activities should include review checks confirming that:

- approved repository structure is addressed;
- baseline and non-baseline material are addressed;
- generated artifact handling is addressed;

- review and contribution conventions are addressed; and
- cleanup and exclusion rules are addressed.

Traceability

This requirement establishes the repository workflow discipline used to protect the Phase 0 implementation baseline.
