

P4-REQ-21-12-004

[Return to Requirements](#)

Statement

Each approved script SHALL identify its expected outputs.

Source

Part 4, Section 21.12: Script and Execution Requirements.

Rationale

Expected outputs define the observable results produced by a script and allow contributors to determine whether the script completed its intended task.

Output identification also supports repeatability, review, cleanup, and distinction between governed outputs and temporary material.

Applies To

This requirement applies to:

- approved scripts;
- generated outputs;
- build outputs;
- logs and reports; and
- repository modifications produced by scripts.

Verification

Verification SHALL confirm that each approved script identifies its expected outputs.

Verification activities should include review checks confirming that:

- expected files or artifacts are documented;
- expected logs or reports are identified;
- repository changes are identified where applicable; and
- unexpected outputs do not silently enter the baseline.

Traceability

This requirement establishes the output expectations associated with approved Phase 0 scripts.
