

3.4 Traceability Position

[Go to Top](#)

The Financial Systems Archetype uses the following [Traceability](#) position.

SIP-RA provides the parent with a structured information processing discipline. FDIS-RA provides financial-domain [Interpretation](#) alignment. The original FX Demo [Reference Architecture](#) provides source material that the new document set normalises across the proper architectural layers.

This [Traceability](#) position prevents three kinds of confusion.

First, it prevents FDIS-RA from replacing SIP-RA as the parent [Reference Architecture](#). Second, it prevents the original FX Demo [Reference Architecture](#) from remaining a mixed-layer controlling document. Third, it prevents implementation details from moving upward into the conceptual architecture.

Part 1, therefore, defines only the conceptual architecture. Later parts carry forward logical, domain-profile, implementation, deployment, testability, and [Evidence](#) concerns while preserving [Traceability](#) back to this conceptual foundation.
