

6.7 Classification Governance

Classification governance ensures that authors deliberately introduce new Ecosystems and Domains.

A later part or profile can introduce a new financial Ecosystem or Domain only when the existing classification path does not cover the intended business or semantic scope.

When a later part introduces a new financial classification, it can identify:

- Parent Ecosphere
- Parent Ecosystem, where applicable
- New Domain
- Reason the new classification is needed
- Relationship to existing classifications
- Parts, profiles, implementation artefacts, deployment artefacts, or evidence packages that use the new classification

Classification governance prevents local implementation choices from creating unintended financial-domain classifications.
