

11.7 Deployment Artifacts Do Not Redefine Implementation Artifacts

[Go to Top](#)

Deployment artifacts describe how implementation artifacts run in a concrete environment. They do not redefine the implementation artifacts or the conceptual elements behind them.

For example, a Kubernetes pod may deploy a containerised [Node](#) implementation. The pod does not become the [Node Identity](#). A namespace may help organize deployment resources. The namespace does not become the [Domain](#), [Ecosystem](#), or [Runtime Plane](#).
