

12.3 Logical Architecture Preserves Conceptual Meaning

[Go to Top](#)

The [Logical Architecture](#) / [PIM](#) preserves the meaning of the conceptual elements defined in Part 1.

A logical element may specialise, refine, constrain, or relate a conceptual element. It does not redefine the conceptual element. A Logical [Node](#) remains a specialisation of [Node](#). A logical endpoint remains a specialisation of [Communication Endpoint](#). A logical information structure remains a specialisation of [Data Structure Definition](#). A logical plane remains a specialisation of the [Runtime Plane](#).

Preserving conceptual meaning maintains the architecture's onion structure. The logical layer builds outward from the conceptual layer rather than replacing it.
