

10.8 Request Policy Decision

[Go To Top](#)

The Request Policy Decision pattern allows a [Logical Node](#) to request a governed decision about access, disclosure, safeguarding, release, redaction, transformation, marking, obligations, or controlled movement of information.

A requesting [Logical Node](#) provides the information subject to evaluation, the intended recipient or consumer, the purpose, the requested release or handling action, the applicable policy context, the classification or marking context, and the provenance reference.

The interaction belongs primarily to the [Logical Policy and Release Plane](#). It also connects to the [Logical Data Plane](#) when the decision concerns domain information, and to the [Logical Audit and Provenance Plane](#) when the architecture records the request, decision, rationale, and obligations.

Table 10-7: Request Policy Decision logical interaction pattern

Element	Logical treatment
Primary Runtime Plane	Logical Policy and Release Plane
Producing Logical Node Role	Release Requester, Data Producer, Oversight Gateway, or Policy Client
Consuming Logical Node Role	Policy Evaluation Node, Release Control Node, or Policy Authority Node
Primary information	Policy decision request
Supporting information	Information subject, intended recipient, purpose, policy context, classification context, provenance reference
Traceability expectation	Policy request traces to the information subject, requesting Logical Node , policy context, intended recipient, and purpose.
Evidence expectation	Policy request and decision records support release review, audit, and accountability.
