

13.2 How Domain Profiles Specialise the Logical Architecture

[Go To Top](#)

A Domain Logical Profile specialises the Logical Architecture / PIM by applying it to a defined Classification Path and financial Domain.

The Domain Logical Profile identifies the Domain it addresses, the logical [Nodes](#) that participate in that Domain, the logical [Node Roles](#) those Nodes perform, the logical [Communication Endpoints](#) those Nodes use, the logical [Data Structure Definitions](#) that govern exchanged information, the logical Runtime Planes that classify interactions, and the logical [Traceability](#) relationships that support review.

The Domain Logical Profile also identifies inherited logical elements and specialised logical elements. Inherited logical elements remain unchanged from this part. Specialised logical elements add Domain-specific responsibilities, structures, interactions, constraints, or [Evidence](#) expectations while preserving the logical meaning defined here.
