

9.1 Overview

Go To FX Demo Logical Information Model

The FX Demo Logical Information Model specializes the Part 2 Logical Information Model for the [Foreign Exchange Domain](#).

The model defines FX logical information structures that FX logical [Nodes](#) exchange, validate, interpret, compute, govern, release, audit, trace, replay, reconstruct, and provide [Evidence](#) for. These structures preserve the distinction between logical information definitions and populated logical information instances.

The FX Demo Logical Information Model does not prescribe [IDL](#) structures, [Protocol Buffers](#) messages, JSON Schema definitions, XML Schema definitions, Avro schemas, OpenAPI schemas, ontology classes, database tables, generated language types, files, wire formats, or runtime payloads. Implementation profiles select those representation mechanisms.

Figure 9-1 summarises the primary FX logical information structures.

```
FX Demo Logical Information Model
├── FX Transaction Candidate
├── FX Transaction Record
├── FX Validation Result
├── FX Semantic Assertion
├── FX Contract State
├── FX Cash-Flow Obligation
├── FX Policy Decision
├── FX Release Package
├── FX Audit Record
├── FX Provenance Record
├── FX Node Status
├── FX Control Command
├── FX Command Acknowledgement
├── FX Replay Request
└── FX Replay Result
```
