

15.1 Overview

[Go To Relationship to Implementation Profiles / PSM](#)

An Implementation Profile / [PSM](#) maps the FX Demo Logical Profile to selected implementation technologies, data representations, communication mechanisms, runtime packaging approaches, and implementation artefacts.

This part defines the platform-independent FX logical profile. An Implementation Profile / [PSM](#) defines how a selected implementation realises that profile. The implementation profile preserves the FX logical meaning of FX logical [Nodes](#), [Node Roles](#), [Communication Endpoints](#), information structures, [Runtime Planes](#), interaction patterns, governance relationships, and [Traceability](#) relationships.

An Implementation Profile / [PSM](#) does not redefine the Part 1 Conceptual Architecture, the Part 2 Logical Architecture / [PIM](#), or the FX Demo Logical Profile. It provides technology-specific mappings from FX logical elements to implementation artefacts.
