

7.5 Generated Types as Phase 0 Implementation Data Artifacts

[Go To Phase 0 Technology Selection and Implementation Context](#)

Phase 0 uses generated types as implementation data artifacts derived from governed [IDL](#) structures.

Generated types provide language-specific representations of selected IDL structures. Implementation Nodes use generated types to publish, subscribe to, process, record, validate, or acknowledge Phase 0 data exchanges, where applicable.

Generated types must remain distinguishable from hand-authored artifacts. Each generated file must identify its source IDL definition, generator, generation context, regeneration policy, and manual-editing status.

Generated types do not redefine IDL structures or FX logical information structures. They realize the selected implementation representation generated from the IDL baseline.
