

14.10 Build Artifacts

[Go To Phase 0 Repository and Build Artifact Model](#)

Build artifacts are outputs created during generation, preparation, packaging, or build activity.

Build artifacts may include generated source files, generated bindings, compiled artifacts, intermediate files, logs, reports, manifests, dependency records, or other outputs produced by Phase 0 build and generation processes.

The repository must distinguish governed build artifacts from temporary build outputs. Governed generated artifacts may belong in a controlled generated-code location when the implementation profile requires review or distribution. Temporary build outputs should remain outside governed source locations or be excluded from version control according to the Developer Handbook.

Build artifacts support implementation work. They do not define logical architecture or implementation governance by themselves.
