

3.3 FX Demo Logical Profile Baseline

[Go To Top](#)

[Return to Phase 0 Baseline](#)

The FX Demo Logical Profile [Baseline](#) applies the reusable logical architecture to the foreign exchange demonstration context. It identifies the demonstration-specific logical [Nodes](#), topics, [Lifecycle](#) concepts, and supporting [Artifacts](#) that Phase 0 begins to realise.

The team uses this profile to decide which Phase 0 Nodes and topics belong in the initial executable Baseline. The profile provides the context for the Hello World-style Node network and ensures that even simple Phase 0 Nodes represent future FX demonstration responsibilities.

In Phase 0, the FX Demo Logical Profile does not require full ACTUS computation, complete [Transaction](#) Lifecycle processing, full financial semantics, or external release governance. It provides the logical shape of the demonstration so that the first implementation Baseline grows in the right direction.

The team should treat the FX Demo Logical Profile as the demonstration anchor. When developers add Nodes, topics, [Configuration](#) files, generated [Types](#), or scripts, they should verify that these Artifacts support the agreed-upon FX demonstration profile.
