

4.7 Test Directories

[Go To Top](#)

[Return to Repository Layout](#)

The tests/ directory should contain tests and [Validation](#) checks for the Phase 0 [Baseline](#). These may include script tests, [Type](#) generation checks, [Configuration](#) Validation, [Node Lifecycle](#) checks, [Control Plane](#) topic checks, container execution checks, and acceptance tests.

A representative structure is:

```
tests/  
  scripts/  
  generation/  
  config/  
  nodes/  
  control-plane/  
  containers/  
  acceptance/
```

Tests should support repeatability and review. A developer should be able to run the relevant tests after changing source files, scripts, Configuration, [IDL](#) definitions, containers, or generated [Artifact](#) workflows.

The team should distinguish development tests from acceptance [Evidence](#). Tests help the team check behaviour during development. Evidence Artifacts document what the team observed during Validation of the Phase 0 Baseline.
