

4.8 Documentation Directories

[Go To Top](#)

[Return to Repository Layout](#)

The docs/ directory should contain project documentation that belongs with the [Repository](#). This may include developer notes, Repository instructions, generated documentation references, design notes, script usage, [Node](#) catalogue material, topic catalogue material, and acceptance documentation.

A representative structure is:

```
docs/  
  handbook/  
  developer-notes/  
  nodes/  
  topics/  
  scripts/  
  acceptance/
```

The team should use Repository documentation to explain implementation-specific details. The architecture documents remain authoritative for conceptual, logical, and [Domain](#) meaning. Repository documentation should help developers understand how the Phase 0 implementation expresses those architectural decisions.

Documentation should stay close to the [Artifacts](#) it explains when practical. For example, script documentation should match actual script behaviour, Node documentation should match actual Node responsibilities, and topic documentation should match the [IDL](#) and [DDS](#) topic definitions used by the implementation.
