## About

The term Distributed Immutable Data Objects (DIDO) refers to the underlying technologies that support distributed data and computation across a network of peers, using consensus algorithms to maintain integrity and consistency. After the publication of Satoshi Nakamoto's paper *Bitcoin: A Peer-to-Peer Electronic Cash System*<sup>1)</sup> Given the exponential growth of other cryptocurrencies, there is a need to understand, in general terms, the underlying DIDO architectures and provide a framework to enable engineering due diligence of DIDOs. DIDOs are not limited to cryptocurrencies, the original blockchain, or distributed ledger technologies. DIDOs are applicable to other non-cryptocurrency domains such as supply chain, registries for birth, deaths, etc., and lists of identification and authentication (IA) acceptable certificates, including those that have been revoked. The DIDO concepts are captured within a [reference architecture](#), intended to represent any architectures relying on distributed networks of peers that store data and allow parallel computation. The DIDO RA is not intended as a physical "must-have" requirements list, but more as a conceptual catalogue of what "can-be".

## WIKI Organisation

The DDS Foundation WIKI site is organised into private and public areas.

```
: [[dido:private|Private Area]]  
: for internal use only, and is never intended for migration from the site  
: [[dido:public|Public Area ]]  
: is a sandbox/development area. The information here is ultimately  
intended for public consumption
```
